addfit	<i>Add zernike coefficients to a matrix.</i>
--------	--

Description

Add zernike coefficients to a matrix.

Usage

```
addfit(..., th = 0, zcm = NULL, theta = numeric(0))
```

Arguments

...	One or more fits as from <code>psifit</code> , etc.
th	Rotation angles, in degrees
zcm	The matrix to be added to (defaults to <code>NULL</code>)
theta	The vector of rotation angles to be added to

Author(s)

aiapsi

*Iterative algorithms for PSI with unknown phase shifts***Description**

Three iterative algorithms for PSI with unknown phase shifts.

Usage

```
aiapsi(im.mat, phases, maxiter = 20, ptol = 0.001,
      trace = 1, plotprogress = TRUE)
hkpsi(im.mat, phases, maxiter = 20, ptol = 0.001,
      trace = 1, plotprogress = TRUE)
tiltpsi(im.mat, phases, x, y, tilts = NULL, nlpref = 1, tlim = 0.5,
      maxiter = 20, ptol = 0.001, trace = 1, plotprogress=TRUE)
```

Arguments

<code>im.mat</code>	a <i>matrix</i> of interferogram values
<code>phases</code>	Starting guess for phase shifts
<code>maxiter</code>	Maximum number of iterations
<code>ptol</code>	Convergence criterion for phase shifts
<code>trace</code>	Print some summary data every <code>trace</code> 'th iteration.
<code>plotprogress</code>	Plot some summary data for each iteration? Also, for <code>tiltpsi</code>
<code>x</code>	x coordinate for each pixel.
<code>y</code>	y coordinate for each pixel.
<code>tilts</code>	Starting guess for tilts.
<code>nlpref</code>	Preferred nonlinear optimizer.
<code>tlim</code>	Maximum tilt difference from overall tilt values.

Details

The default of `tilts = NULL` will set the starting guess for all tilts to 0.

`nlpref` picks the preferred nonlinear optimizer in function `tiltpsi`. The default choice uses the base package function `nlminb`. If `nlpref > 1` the function `solnp` from package `Rsolnp` is used instead.

Value

A list containing the following elements:

<code>phi</code>	The wrapped phase estimate. This is a vector as long as the number of rows in <code>im.mat</code> .
<code>mod</code>	Modulation estimate.
<code>phases</code>	Phase shift estimates.
<code>iter</code>	Number of iterations.

sse Sum squared error at each iteration.
 Also, for tiltpsi
 tilts Final tilt estimates, given as offsets from frame 1 tilts.

astig.bath	<i>Zernike coefficients for astigmatism due to Bath astigmatism.</i>
------------	--

Description

Calculates Bath astigmatism coefficients with optional rotation of phi degrees.

Usage

```
astig.bath(D, rc, s, lambda = 1e-06, phi = 0)
```

Arguments

D	Diameter
rc	Radius of curvature
s	separation of reference and test beams
lambda	Wavelength – defaults to 1 nm.
phi	angle of image horizontal relative to interferometer axis, in degrees

Details

D, rc, s, and lambda must have the same units.

Value

The Zernike coefficients for primary astigmatism terms.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

circle.pars	<i>Pupil parameters</i>
-------------	-------------------------

Description

Automatically determine the center and radius of a circular interferogram image.

Usage

```
circle.pars(im, fw=2, qt=0.995, excl=5, refine=2,
            plots=TRUE, ask=TRUE, details=FALSE)
```

Arguments

im	A matrix containing an image of a circular disk
fw	Amount to smooth image
qt	Threshold to accept an edge point, expressed as a quantile
excl	number of pixels around border of frame to exclude
refine	radius range in pixels for a second pass estimate
plots	Plot edge candidates and fit?
ask	Wait for input before displaying fit?
obstructed	Logical: is there a central obstruction?

Details

This routine partially implements the Canny algorithm for edge detection. After optionally smoothing the input image the gradient is calculated using a Sobel filter, and edge pixels are identified by locating local maxima in the magnitude of the gradient.

The edge pixels with `qt` percentile largest gradients are passed to `lqs` in package `MASS` to determine robustly the best fit circle.

Finally, if `refine > 0`, *all* edge points within \pm `refine` pixels of the previously determined edge are passed to `nls` for a second estimate of center point and radius.

Value

A list with the following components:

xc	X coordinate of the center of the pupil
yc	Y coordinate of the center of the pupil
rx	Horizontal radius of the pupil
ry	Vertical radius of the pupil = rx
obstruct	Obstruction fraction (always = 0)

Note

This routine is only effective on modulation estimates, and will almost certainly fail on interferogram images. Since data quality varies widely considerable experimentation may be needed on any given image. Increasing the smoothing parameter `fw` helps to suppress artifacts. Depending on how strong the actual edge is compared to artifacts `qt` may need to be either increased or decreased from the default value.

if `details==TRUE` several more pieces of data are returned. This is mostly for debugging purposes and may be eliminated in the future.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

Many routines require the pupil parameters in the form returned by `circle.pars`. For example [psifit](#), [fftfit](#), [pupil](#), etc.

col3d

OpenGL plot

Description

Returns a vector of colors similar to `image()` display.

Usage

```
col3d(surf, surf.col=topo.colors(256), zlim = NULL, eqa=FALSE)
```

Arguments

<code>surf</code>	A matrix of surface values
<code>surf.col</code>	Color palette for surface
<code>zlim</code>	Range of values to display
<code>eqa</code>	Equal area per color

Value

A vector of color values the same length as `surf`.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

References

The **rgl** package is described at <http://rgl.neoscientists.org/about.shtml>, and available from CRAN.

[plot.pupil](#)

convolve2d	<i>2D convolution</i>
------------	-----------------------

Description

General 2D convolution using FFTs

Usage

```
convolve2d(im, kern)
```

Arguments

im	A matrix representing an image
kern	the convolution kernel

Value

The filtered matrix im.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

[gblur](#). Called by [circle.pars](#).

crop	<i>Crop an array</i>
------	----------------------

Description

Crop a matrix or 3D array. Main application is to trim excess pixels from an image array, wavefront, etc.

Usage

```
crop(img, cp, npad = 20)
```

Arguments

img	Array to be cropped.
cp	A list describing the pupil boundary.
npad	Amount of padding to leave around the edge.

Details

cp is the list provided by [circle.pars](#).

Value

im	The cropped array
cp	Revised value of cp

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

fftfit

Fourier transform interferogram analysis

Description

High level routines for FFT analysis of interferograms.

Usage

```
fftfit(imagedata, cp = NULL, fringescale = 1,
      sl = c(1, 1), filter = NULL, taper = 2,
      zlist = makezlist(), zc0 = c(1:3, 6:7),
      satarget = c(0, 0), astig.bath = c(0, 0),
      puw.alg = "qual", uselm = FALSE, sgs = 3, plots = TRUE, CROP = FALSE)
```

Arguments

imagedata	A matrix containing the interferogram
cp	A list describing the pupil boundary, as returned by pupil.pars
fringescale	Fringe spacing, in waves. Use 1 for single pass, 0.5 for double pass, etc.
sl	Position of sidelobe in the form c(x,y)
filter	Size of background filter around DC
taper	Size of taper applied to edge of half plane cut
zlist	Indexes of Zernike polynomials to fit to wavefront
zc0	Indexes of Zernike coefficients to be removed from net wavefront
satarget	Target 4th and 6th order SA coefficients in non-null tests of aspheres
astig.bath	Astigmatism coefficients for Bath geometry
puw.alg	Algorithm to use for phase unwrapping
uselm	Logical: use lm() for least squares fit
sgs	Sample Grid Spacing for least squares fits to wavefront values
plots	Logical: plot progress?
CROP	Center and crop maps?

Details

If `is.null(filter)` (the default), `pick.sidelobe` will be called to select a Fourier domain sidelobe and background filter size.

If `is.null(cp)` `circle.pars` is applied to the modulation to estimate the pupil parameters.

See [wf.net](#) for details of the process of creating net and smoothed wavefronts from raw unwrapped wavefront maps.

`puw.alg` Specifies the unwrapping algorithm. If `NULL` an algorithm that's likely to be successful will be selected. You can specify an algorithm by choosing `puw.alg=c("brcut", "ls", "lp", "modal", "`

Value

A list with the following components:

<code>phase</code>	Wrapped phase map
<code>mod</code>	The estimated modulation
<code>cp</code>	A list describing the pupil boundary
<code>cp.orig</code>	The precropped value of <code>cp</code>
<code>wf.net</code>	Net unsmoothed wavefront; a matrix of class " pupil "
<code>wf.smooth</code>	Net smoothed wavefront
<code>wf.residual</code>	Difference between net wavefront and polynomial fit
<code>fit</code>	Return value from fitzernikes
<code>zcoef.net</code>	Net Zernike coefficients from fit

Note

These functions are based largely on the work of Roddier and Roddier (1987).

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

References

Roddier, C. and Roddier, F. 1987, **Interferogram analysis using Fourier transform techniques**, *Applied Optics*, vol. 26, pp. 1668-1673.

See Also

[wf.net](#), [pupil.pars](#), [pick.sidelobe](#).

Description

Miscellaneous utilities for working with 2D images in the Fourier domain.

Usage

```
wftophase(X, lambda=1)
padmatrix(X, npad, fill = 0)
submatrix(X, size = 255)
fftshift(X)
.up2(nr, nc=nr)
```

Arguments

X	A matrix
lambda	Value of the wavelength, in the same units as X
npad	Size of padded matrix
fill	Values to be assigned to padded matrix elements
size	Size of returned matrix
nr	A number
nc	A number

Details

wftophase computes the complex phase from wavefront values.

padmatrix pads a matrix to size npad x npad, placing the original matrix in the lower left hand corner of the padded matrix.

submatrix extracts a size x size matrix from the center of a larger matrix.

fftshift shuffles the quadrants of a matrix around to put the DC element (1,1) in the center of the transformed matrix, with spatial frequencies increasing to the right and up.

Value

A matrix transformation of the input matrix X.

.up2 returns the next higher power of 2 than max(nr, nc).

Note

These low level routines are used by several higher level functions that operate in the Fourier domain.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

[startest](#), [fftfit](#).

fitzernikes*Least Squares fit to Zernike polynomials*

Description

Performs a least squares fit of a specified set of Zernike polynomials to a vector of wavefront measurements.

Usage

```
fitzernikes(wf, rho, theta, phi = 0, maxorder = 14, uselm = FALSE)
```

Arguments

wf	A vector of wavefront values
rho	A vector of radial coordinates.
theta	A vector of angular coordinates, in radians.
phi	Orientation of the image, in degrees
maxorder	Maximum Zernike polynomial order
uselm	Boolean: use <code>lm()</code> for least squares fit

Details

wf, rho, and theta must be the same length.

Value

The model fit as returned by [lm](#), or the coefficients of the least squares fit if `uselm` is FALSE.

Note

The model fit is of the form $wf \sim Z_0 + Z_1 + Z_2 + \dots$. With the standard ordering of Zernikes Z_0 is the piston term, Z_1 and Z_2 are x and y tilts, Z_3 is defocus, etc.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

[zpm](#), [psifit](#), [fftfit](#), [wf.net](#).

foucogram

*Simulate a Foucaultgram***Description**

Simulates the appearance of a wavefront under the Foucault test.

Usage

```
foucogram(wf, edgex = 0, phradius = 0, slit = FALSE,
          pad = 4, gamma = 1, map = FALSE, lev = 0.5)
```

Arguments

wf	An object of class <code>pupil</code> containing wavefront values
edgex	lateral position of knife edge
phradius	radius of light source
slit	Logical: Is source a slit or pinhole?
pad	pad factor for FFT
gamma	Gamma value for graphics display
map	Logical: Overlay contours from wavefront map?
lev	Increment for contour levels, if used

Details

The default value of 0 for `phradius` simulates a monochromatic point source. Try values in the range 10-30 to suppress diffraction effects.

Value

A matrix of intensity levels in the simulated image.

Note

The key approximations here are treating the light source as monochromatic and spatially coherent, which is usually not the case for an extended source. Also, Fraunhofer diffraction theory is used.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

References

See http://home.netcom.com/~mpeck1/astro/foucault/ext_foucault.pdf for an outline of the mathematical treatment of an extended source.

See Also

`pupil`

`gblur`*Gaussian blur*

Description

Blur an image by fw pixels

Usage

```
gblur(X, fw=0, details=FALSE)
```

Arguments

<code>X</code>	A matrix representing an image
<code>fw</code>	Width of the Gaussian convolution kernel, in pixels
<code>details</code>	Return convolution kernel?

Details

`fw` is the standard deviation of the Gaussian.

Value

The filtered matrix `X`.

Note

the `details` option is mostly for debugging purposes and may go away.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

[convolve2d](#)

`gray256`*8 bit Grayscale*

Description

A vector of gray scale levels

Usage

```
gray256  
grey256
```

Value

Defined as `gray256 <- grey(seq(0,1,length=256))`

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>.

hypot	<i>Hypotenuse</i>
-------	-------------------

Description

The Euclidean length of a vector

Usage

```
hypot(x)
```

Arguments

`x` a vector

Value

the length of the vector

Author(s)

M.L. Peck

Examples

```
hypot(c(1,2))
```

idiffpuw	<i>Phase unwrapping by Integrating DIFFerences</i>
----------	--

Description

Simple path following algorithm for two dimensional phase unwrapping.

Usage

```
idiffpuw(phase, mask = phase, ucall = TRUE, dx = NULL, dy = NULL)
```

Arguments

phase	A matrix of wrapped phase values
mask	Matrix the same size as phase indicating masked pixels
ucall	Boolean: User call?
dx	Matrix of x differences
dy	Matrix of y differences

Details

mask indicates pixels that shouldn't be unwrapped. In the simplest (default) case these are just pixels where phase is undefined.

Value

if (ucall), a matrix of class "pupil" with unwrapped wavefront values, otherwise a list with items:

puw	Unwrapped phase
uw	Matrix indicating pixels that have been unwrapped.

Note

Both `brcutpuw` and `modalpuw` call `rmap` first to check for the presence of residues. If there are none `idiffpuw` is guaranteed to work and is called to do the phase unwrapping.

If there *are* residues `brcutpuw` creates a mask then calls `idiffpuw` to unwrap unmasked portions of the phase map.

This function is user callable as well; use a call of the form `idiffpuw(phase)`.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>. Thanks to Steve Koehler for programming ideas to considerably speed up the algorithm.

References

Ghiglia, D.C., and Pritt, M.D., 1998, **Two-Dimensional Phase Unwrapping**, New York: Wiley & Sons, Inc., ISBN 0-471-24935-1.

`rmap`, `brcutpuw`, `modalpuw`

itfit

*Iterative algorithms for Phase Shifting Interferometry***Description**

High level function that calls one of the iterative algorithms for PSI.

Usage

```
itfit(images, phases, cp=NULL,
      maxiter=20, ptol=0.001, trace=5, uselm=FALSE, plotprogress=TRUE,
      fringescale=1, zlist=makezlist(), zc0=c(1:3, 6:7),
      satarget=c(0,0), astig.bath=c(0,0)
      puw.alg = "qual", uselm=FALSE, sgs=3, plots=TRUE, CROP=FALSE)
```

Arguments

images	An array containing the interferogram images
phases	A vector of phase shifts
cp	A list describing the pupil boundary, as returned by pupil.pars
maxiter	maximum number of iterations of phase shift updates
ptol	A measure of phase shift convergence tolerance
trace	print trace of phase step estimates
uselm	call nlminb to estimate optimum?
plotprogress	Logical - plot progress of phase shift estimation?
fringescale	Fringe spacing, in waves. Use 1 for single pass, 0.5 for double pass, etc.
zlist	Indexes of Zernike polynomials to fit to wavefront
zc0	Indexes of Zernike coefficients to be removed from net wavefront
satarget	Target 4th and 6th order SA coefficients in non-null tests of aspheres
astig.bath	Astigmatism coefficients for Bath geometry
puw.alg	Algorithm to use for phase unwrapping
uselm	Boolean: use lm() for least squares fit
sgs	Sample Grid Spacing for least squares fits to wavefront values
plots	Logical: plot progress?
CROP	Center and crop maps?

Details

images is a 3 dimensional array with dimensions `nrow x ncol x length(phases)`, where `nrow` and `ncol` are the number of rows and columns in the individual interferogram images.

If `cp == NULL` [circle.pars](#) is called to construct the interferogram mask automatically.

See [wf.net](#) for details of the process of creating net and smoothed wavefronts from raw unwrapped wavefront maps.

`puw.alg` specifies the unwrapping algorithm. You can specify an algorithm by choosing `puw.alg=c("brcut", "l`

Value

A list with the following components:

phase	Raw, wrapped phase map
mod	The estimated modulation
cp	A list describing the pupil boundary
cp.orig	Uncropped value of cp
wf.net	Net unsmoothed wavefront; a matrix of class " pupil "
wf.smooth	Net smoothed wavefront
wf.residual	Difference between net wavefront and polynomial fit
fit	Return value from fitzernikes
zcoef.net	Net Zernike coefficients from fit
phases	final phase shift estimates

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

itfit

Iterative algorithms for Phase Shifting Interferometry

Description

High level function that calls one of the iterative algorithms for PSI.

Usage

```
itfit(images, phases, cp=NULL,
      maxiter=20, ptol=0.001, trace=1, plotprogress=TRUE, REFINE=TRUE,
      tilts=NULL, tlim=0.5, nlpref=1,
      it.alg = c("aia", "hk", "tilt"),
      fringescale=1, zlist=makezlist(), zc0=c(1:3, 6:7),
      satarget=c(0,0), astig.bath=c(0,0)
      puw.alg = "qual", uselm=FALSE, sgs=1, plots=TRUE, CROP=FALSE)
```

Arguments

<code>images</code>	An array containing the interferogram images
<code>phases</code>	A vector of phase shifts
<code>cp</code>	A list describing the pupil boundary, as returned by pupil.pars
<code>maxiter</code>	maximum number of iterations of phase shift updates
<code>ptol</code>	A measure of phase shift convergence tolerance
<code>trace</code>	print trace of phase step estimates
<code>plotprogress</code>	Logical - plot progress of phase shift estimation?
<code>REFINE</code>	Logical - run the algorithm a second time after calculating mask
<code>tilts</code>	initial guess of tilts
<code>tlim</code>	tilt value limit
<code>nlpref</code>	preferred nonlinear optimizer
<code>it.alg</code>	iterative algorithm to use
<code>fringescale</code>	Fringe spacing, in waves. Use 1 for single pass, 0.5 for double pass, etc.
<code>zlist</code>	Indexes of Zernike polynomials to fit to wavefront
<code>zc0</code>	Indexes of Zernike coefficients to be removed from net wavefront
<code>satarget</code>	Target 4th and 6th order SA coefficients in non-null tests of aspheres
<code>astig.bath</code>	Astigmatism coefficients for Bath geometry
<code>puw.alg</code>	Algorithm to use for phase unwrapping
<code>uselm</code>	Boolean: use <code>lm()</code> for least squares fit
<code>sgs</code>	Sample Grid Spacing for least squares fits to wavefront values
<code>plots</code>	Logical: plot progress?
<code>CROP</code>	Center and crop maps?

Details

`images` is a 3 dimensional array with dimensions `nrow` x `ncol` x `length(phases)`, where `nrow` and `ncol` are the number of rows and columns in the individual interferogram images.

If `cp == NULL` [circle.pars](#) is called to construct the interferogram mask automatically. If `REFINE == TRUE` the selected iterative algorithm will be called a second time with the masked data. Selecting `cp = NULL` will generate an error if `it.alg == "tilt"`.

The arguments `tilts`, `tlim` and `nlpref` are passed to [tiltpsi](#) if `it.alg == "tilt"` and are ignored otherwise.

`puw.alg` specifies the unwrapping algorithm. You can specify an algorithm by choosing `puw.alg=c("brcut", "1"`

See [wf.net](#) for details of the process of creating net and smoothed wavefronts from raw unwrapped wavefront maps.

Value

A list with the following components:

<code>phase</code>	Raw, wrapped phase map
<code>mod</code>	The estimated modulation
<code>phases</code>	final phase shift estimates

```

cp          A list describing the pupil boundary
cp.orig     Uncropped value of cp
wf.net      Net unsmoothed wavefront; a matrix of class "pupil"
wf.smooth   Net smoothed wavefront
wf.residual Difference between net wavefront and polynomial fit
fit         Return value from fitzernikes
zcoef.net   Net Zernike coefficients from fit
iter        Number of iterations of the algorithm
sse         vector of sum squared errors

And, if it.alg == "tilt"

tilts       final estimate of tilts for each frame

```

load.images	<i>Read images</i>
-------------	--------------------

Description

Loads image files in jpeg or tiff format. `load.pgm` provides legacy support for reading files in pgm format.

Usage

```

load.images(files, names=files, channels=c(1,0,0), scale=1, FLIP=FALSE)
load.pgm(files, imdiff=NULL)

```

Arguments

```

files      A vector of character strings with file names
names      Original files
channels    channel weights
scale      scale factor for image resize
FLIP       flip image left for right?

```

Details

set FLIP=TRUE to reverse mirror imaged interferograms.

Value

An array containing the contents of the image files.

Note

`load.pgm` is the original `load.images` included for legacy support of greyscale portable anymap files.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

lspsi

Phase Shifting Interferometry

Description

Least squares fitting of phase shifted interferograms.

Usage

```
lspsi(images, phases, wt = rep(1, length(phases)))
```

Arguments

<code>images</code>	An array containing the interferogram images
<code>phases</code>	A vector of phase shifts
<code>wt</code>	A vector of weights

Details

`images` is a 3 dimensional array with dimensions `nrow` x `ncol` x `length(phases)`, where `nrow` and `ncol` are the number of rows and columns in the individual interferogram images.

Value

A list containing the following components:

<code>phi</code>	Estimated wrapped wavefront phase; a matrix the same size as the interferogram images
<code>B</code>	Terms of the least squares fit; an <code>nrow</code> x <code>ncol</code> x 3 array

Note

Appendix A of Goldberg and Bokor gives a useful summary of the least squares method of phase shifted interferometry analysis. The matrix `B` is defined in Equation A2 and solved in equation A5 of their paper.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

modalfit	<i>Foucault test data reduction</i>
----------	-------------------------------------

Description

Data reduction for moving source Foucault tests.

Usage

```
modalfit(rho, f, rc, R, run = NULL, theta = rep(0, length(rho)),
  zlist = list(n = seq(4, 12, by = 2), m = rep(0, 5), t = rep("n", 5)))
zonalfit(rho, f, rc, R,
  zlist = list(n = seq(4, 12, by = 2), m = rep(0, 5), t = rep("n", 5)))
```

Arguments

rho	A vector of relative zonal radii
f	A vector of longitudinal aberration measurements
rc	Radius of curvature of the mirror
R	Semi-diameter of the mirror
run	A vector of factor levels, if different measurement runs are included
theta	Orientation angle of the mirror, if different orientations are present
zlist	Indexes of Zernikes to be fit

Details

All linear measurements must be in millimeters.

Value

A long list describing the fit to the data. Please contact the author if you need details.

Note

These are provided for completeness only. Please contact me if you need details on their use.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

References

Modal analysis of Foucault test data is described by the author in <http://home.netcom.com/~mpeck1/astro/modal/modal.pdf>.

pcafit

Principal Component Analysis for Phase Shifting Interferometry

Description

Implements an algorithm proposed by Vargas et al. (2011) to estimate phase in PSI with principal components.

Usage

```
pcafit(images, cp=NULL,
        BGSUB = TRUE, REFINE = TRUE,
        fringescale=1, zlist=makezlist(), zc0=c(1:3, 6:7),
        satarget=c(0,0), astig.bath=c(0,0),
        puw.alg="qual", uselm=FALSE, sgs=1, plots=TRUE, CROP=FALSE)
```

Arguments

images	An array containing the interferogram images
cp	A list describing the pupil boundary, as returned by pupil.pars
BGSUB	Logical: subtract pixel-wise mean?
REFINE	Logical: calculate phase again after finding interferogram edge?
fringescale	Fringe spacing, in waves. Use 1 for single pass, 0.5 for double pass, etc.
zlist	Indexes of Zernike polynomials to fit to wavefront
zc0	Indexes of Zernike coefficients to be removed from net wavefront
satarget	Target 4th and 6th order SA coefficients in non-null tests of aspheres
astig.bath	Astigmatism coefficients for Bath geometry
puw.alg	Algorithm to use for phase unwrapping
uselm	Boolean: use lm() for least squares fit
sgs	Sample Grid Spacing for least squares fits to wavefront values
plots	Logical: plot progress?
CROP	Center and crop maps?

Details

`images` is a 3 dimensional array with dimensions `nrow` x `ncol` x `length(phases)`, where `nrow` and `ncol` are the number of rows and columns in the individual interferogram images.

If `cp == NULL` `circle.pars` is called to construct the interferogram mask automatically.

If `REFINE == TRUE` `pcapsi` is called again with the masked image data after the calculation of `cp`. If `!is.null(cp)` in the function call `REFINE` is ignored.

See [wf.net](#) for details of the process of creating net and smoothed wavefronts from raw unwrapped wavefront maps.

`puw.alg` specifies the unwrapping algorithm. You can specify an algorithm by choosing `puw.alg=c("brcut", "1`

Value

A list with the following components:

<code>phase</code>	Raw, wrapped phase map
<code>mod</code>	The estimated modulation
<code>phases</code>	final phase shift estimates
<code>cp</code>	A list describing the pupil boundary
<code>cp.orig</code>	Uncropped value of <code>cp</code>
<code>wf.net</code>	Net unsmoothed wavefront; a matrix of class " pupil "
<code>wf.smooth</code>	Net smoothed wavefront
<code>wf.residual</code>	Difference between net wavefront and polynomial fit
<code>fit</code>	Return value from fitzernikes
<code>zcoef.net</code>	Net Zernike coefficients from fit
<code>snr</code>	An estimate of the signal to noise ratio of the raw data
<code>eigen</code>	The singular values of the input crossproduct matrix

pcapsi

*Vargas et al.'s Principal Components method for PSI***Description**

Compute the phase using the Principal components algorithm.

Usage

```
pcapsi(im.mat, BGSUB)
```

Arguments

im.mat	A <i>matrix</i> of interferogram values
BGSUB	Logical - subtract the pixelwise mean as background estimate?

Details

Images are input into an array by `load.images`. This must be reshaped into a matrix for this function. Also, a mask should be applied if available prior to the call.

Value

A list containing the following elements:

phi	The wrapped phase estimate. This is a vector as long as the number of rows in im.mat.
mod	Modulation estimate.
phases	Phase shift estimates.
snr	An estimate of the signal to noise ratio in the input data.
eigen	Singular values of the crossproduct matrix.

pick.sidelobe	Select an interferogram sidelobe in the Fourier domain
---------------	--

Description

Interactively locate the center of a first order sidelobe in the FFT of an interferogram, and mark the width of the background filter.

Usage

```
pick.sidelobe(imagedata, logm=FALSE, gamma=3)
```

Arguments

imagedata	A matrix containing an interferogram image
logm	Logical: pass <code>fn="logMod"</code> to <code>plot.cmat?</code>
gamma	gamma value for display

Details

Uses the basic graphics utility `locator`.

Value

A list with the following components:

sl	The coordinates $c(x, y)$ of the selected sidelobe
filter	Estimated size of background filter

Note

The high level FFT interferogram analysis routine `fftfit` requires the approximate location of the intended first order interferogram sidelobe to be specified.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

`fftfit`,

plot.cmat	<i>Plot a complex matrix</i>
-----------	------------------------------

Description

Plot a real valued function of a complex matrix

Usage

```
plot.cmat(X, fn = "Mod", col = topo.colors(256),
cp=NULL, zoom=1, gamma=1, ...)
```

Arguments

X	A complex valued matrix
fn	A function returning a real value
col	Color palette for graph
cp	pupil parameters as returned by pupil.pars
zoom	zoom factor for display
gamma	gamma value for display
...	Other parameters to pass to image.default

Details

In addition to the functions described in [complex](#) fn can be assigned the values "logMod", which will call an internally defined function returning the value $\log(1+\text{Mod}(X))$, "Mod2" to plot the power spectrum, and "logMod2" to plot the logarithm of the power spectrum.

If the parameter cp is passed axes will display spatial frequencies in cycles per pupil radius.

Value

none

Note

This is used primarily for displaying FFT's of interferograms. In the case of an interferogram in which the background has not been removed use `fn="logMod"` to make the first order sidelobes visible.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

[localize.sidelobe](#), [fftfit](#).

`plot.pupil`*Pupils and wavefronts*

Description

Plot and summary methods for objects of class "pupil".

Usage

```
plot.pupil(wf, cp=NULL, col = topo.colors(256), addContours = TRUE, cscale = FALSE,
  eqa=FALSE, zlim=NULL, ...)
summary.pupil(wf)
```

Arguments

<code>wf</code>	An object of class "pupil"
<code>cp</code>	Pupil parameters; a list as returned by pupil.pars
<code>col</code>	Color palette for plot
<code>addContours</code>	Logical: add contour lines?
<code>cscale</code>	Add a color scale legend?
<code>eqa</code>	Perform an "equal area" plot?
<code>zlim</code>	z limits to pass to image
<code>...</code>	Additional parameters to pass to image.default

Details

These give simple plot and summary methods for objects of class [pupil](#).

If `eqa` is `TRUE`, each color in the palette will be used for an equal number of pixels (as opposed to representing an equal interval). Note: the color scale (when `cscale == TRUE`) may be inaccurate if a very small number of colors are used.

Value

none

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

[pupil](#), [pupilrms](#), [pupilpv](#), [strehlratio](#), [pupil.pars](#).

`plotn`*Wavefront comparison plots*

Description

Plot an arbitrary number of wavefronts and all differences.

Usage

```
plotn(..., labels = NULL, wftype = "net",  
col = rygcb(400), qt = c(0.01, 0.99))
```

Arguments

<code>...</code>	List of wavefront estimates as returned by wf.net .
<code>labels</code>	Labels to identify the wavefronts.
<code>wftype</code>	If the inputs are from <code>wf.net</code> , one of "net", "smooth", "residual".
<code>col</code>	Color palette for top row of plot
<code>qt</code>	Quantiles of differences to plot in comparisons.

Details

`...` can be any number of objects containing wavefront estimates as returned for example by [wf.net](#).

Wavefronts are displayed on the top row, and differences of all pairs on subsequent rows. Grayscale is used to render the difference plots, and the color palette given in `col` is used for the wavefronts.

Value

none

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

[plot.pupil](#) [wf.net](#)

`plotxs`*Plot cross-sections (profiles) through a wavefront map.*

Description

Plots an arbitrary number of cross-sections through a wavefront map, with one highlighted.

Usage

```
plotxs(wf, cp, theta0 = 0, ylim = NULL, N = 4, n = 101,  
col0 = "black", col = "gray", lty = 2)
```

Arguments

<code>wf</code>	A matrix of wavefront values.
<code>cp</code>	List of pupil parameters as returned by pupil.pars .
<code>theta0</code>	Angle of highlighted profile, in degrees.
<code>ylim</code>	range of heights to plot.
<code>N</code>	Number of cross sections.
<code>n</code>	Number of points for each cross section.
<code>col0</code>	Highlight color.
<code>col</code>	Cross section color.
<code>lty</code>	Line type for plots.

Details

The cross sections are equally spaced in angle from 0 to $\pi * (N-1) / N$. Any angle can be specified for the highlighted profile at `theta0`.

Value

none

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

[plot.pupil](#) is the main wavefront plotting routine.

psifit

*Phase Shifting Interferometry***Description**

High level function for Least squares analysis of phase shifted interferograms.

Usage

```
psifit(images, phases, cp=NULL, wt=rep(1,length(phases)),
       fringescale=1, zlist=makezlist(),
       zc0=c(1:3, 6:7), satarget=c(0,0), astig.bath=c(0,0)
       puw.alg = "qual", uselm=FALSE, sgs=2, plots=TRUE, CROP=FALSE)
```

Arguments

images	An array containing the interferogram images
phases	A vector of phase shifts
cp	A list describing the pupil boundary, as returned by pupil.pars
wt	psifit only: A vector of weights
fringescale	Fringe spacing, in waves. Use 1 for single pass, 0.5 for double pass, etc.
zlist	Indexes of Zernike polynomials to fit to wavefront
zc0	Indexes of Zernike coefficients to be removed from net wavefront
satarget	Target 4th and 6th order SA coefficients in non-null tests of aspheres
astig.bath	Astigmatism coefficients for Bath geometry
puw.alg	Algorithm to use for phase unwrapping
uselm	Boolean: use lm() for least squares fit
sgs	Sample Grid Spacing for least squares fits to wavefront values
plots	Logical: plot progress?
CROP	Center and crop maps?

Details

images is a 3 dimensional array with dimensions `nrow` x `ncol` x `length(phases)`, where `nrow` and `ncol` are the number of rows and columns in the individual interferogram images.

If `cp == NULL` [circle.pars](#) is called to construct the interferogram mask automatically.

See [wf.net](#) for details of the process of creating net and smoothed wavefronts from raw unwrapped wavefront maps.

`puw.alg` specifies the unwrapping algorithm. You can specify an algorithm by choosing `puw.alg=c("brcut", "1`

Value

A list with the following components:

<code>phase</code>	Raw, wrapped phase map
<code>mod</code>	The estimated modulation
<code>cp</code>	A list describing the pupil boundary
<code>cp.orig</code>	Uncropped value of <code>cp</code>
<code>wf.net</code>	Net unsmoothed wavefront; a matrix of class " <code>pupil</code> "
<code>wf.smooth</code>	Net smoothed wavefront
<code>wf.residual</code>	Difference between net wavefront and polynomial fit
<code>fit</code>	Return value from <code>fitzernikes</code>
<code>zcoef.net</code>	Net Zernike coefficients from fit

Note

The low level function implementing the least squares algorithm is `lspsi`.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

`lspsi`, `wf.net`, `hkfit`, `aiafit`, `pcafit`.

pupil

Pupils and wavefronts

Description

Create a pupil object and optionally fill it with a wavefront. For our purposes a “pupil” is defined to be a matrix representation of a circular or annular aperture. Simple plot and summary methods are also provided.

Usage

```
pupil(zcoef=NULL, zlist=makezlist(), phi=0, piston=0,
      nrow=256, ncol=nrow, cp=list(xc=128,yc=128,rx=127,ry=127,obstruct=0),
      obstruct=NULL)
pupil.arb(zcoef=NULL, zlist=makezlist(), phi=0, piston=0,
          nrow=256, ncol=nrow, cp=list(xc=128,yc=128,rx=127,ry=127,obstruct=0),
          obstruct=NULL)
```

Arguments

<code>zcoef</code>	A vector of Zernike coefficients
<code>zlist</code>	List of indexes the same length as <code>zcoef</code>
<code>phi</code>	Amount to rotate image, in degrees
<code>piston</code>	Constant to add to wavefront values
<code>nrow</code>	Number of rows in output matrix
<code>ncol</code>	Number of columns in output matrix
<code>cp</code>	A list with items <code>xc</code> - x coordinate of central pixel, <code>yc</code> - y coordinate of central pixel, <code>rx</code> - x radius in pixels, <code>ry</code> - y radius in pixels, <code>obstruct</code> - central obstruction fraction.
<code>obstruct</code>	Obstruction fraction

Details

`plot.pupil` and `summary.pupil` provide simple plot and summary methods for objects of class "pupil".

`pupil.arb` will accept an arbitrary list of Zernikes.

`pupil` requires a complete set of Zernikes as returned by `makezlist`.

Value

A matrix of size `nrow` x `ncol`. The matrix is assigned to the class "pupil". NA's are used to fill the matrix outside the defined area of the pupil.

Note

The parameter `cp` is used to define the dimensions of the pupil. See `pupil.pars` for details.

`obstruct` is included twice for backward compatability.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

`Zernike`, `makezlist`, `pupilrms`, `pupilpv`, `strehlratio`, `pupil.pars`, `circle.pars`.

Examples

```
wf <- pupil(zcoef=rnorm(length(makezlist())$n), 0, 0.01)
plot(wf, addContours=FALSE)
summary(wf)
```

pupil.pars

Pupil parameters

Description

Interactively determine the center, radius, and obstruction fraction of a circular or annular interferogram image.

Usage

```
pupil.pars(im = NULL, obstructed = FALSE)
```

Arguments

im	A matrix containing an interferogram image
obstructed	Logical: is there a central obstruction?

Details

In `pupil.pars`, if the image has already been plotted `im` can be `NULL`, which is the default.

Value

A list with the following components:

xc	X coordinate of the center of the pupil
yc	Y coordinate of the center of the pupil
rx	Horizontal radius of the pupil
ry	Vertical radius of the pupil
obstruct	Obstruction fraction

Note

`pupil.pars` uses the basic graphics library routine `locator` to interactively mark the edge of the pupil, and optionally the edge of the obstruction. After right clicking to terminate `locator()` a least squares fit is performed to the marked points to determine the center and radius of the pupil.

Note that all routines that make use of Zernikes implicitly assume a circular pupil, or an annular one with small obstruction. We allow `rx != ry` for imaging sensors with non-square aspect ratios.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

Many routines require the pupil parameters in the form returned by `pupil.pars`. For example `psifit`, `fftfit`, `pupil`, etc.

pupil.rhotheta *Polar coordinates*

Description

Calculate matrixes of polar coordinates for [pupil](#)'s.

Usage

```
pupil.rhotheta(nrow, ncol, cp)
```

Arguments

nrow	Number of rows in interferogram images
ncol	Number of columns in interferogram images
cp	A list describing the pupil boundary, as returned by pupil.pars

Value

A list with the following components:

rho	A matrix of radial coordinates
theta	A matrix of angular coordinates

Note

My Zernike polynomial routines work in polar coordinates, which this function provides. Also, NA's are used to fill the matrix outside the pupil boundary, making the returned values convenient for selecting pixels inside interferograms.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

[Zernike](#), [pupil](#).

pupilrms *Wavefront statistics*

Description

Compute basic statistics of wavefronts stored in "pupil" objects.

Usage

```
pupilrms(pupil)
pupilpv(pupil)
strehlratio(rms)
```

Arguments

pupil	A matrix of class "pupil"
rms	An rms wavefront error

Value

Estimates of the RMS and P-V wavefront errors. `strehratio` calculates Mahajan's approximation to the Strehl ratio.

Note

`pupilrms` simply calculates the standard deviation of finite values in the matrix `pupil`. This is a crude, but usually accurate enough estimate of the true RMS wavefront error.

`summary.pupil` calls these functions.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

References

Schroeder, D.J. 2000, *Astronomical Optics, 2nd Edition*, Academic Press, chapter 10.

See Also

`summary.pupil`.

Examples

```
zcoef <- rnorm(length(makezlist())$n, 0, 0.01)
wf <- pupil(zcoef=zcoef)
plot(wf)
summary(wf)
sqrt(crossprod(zcoef)) # A more accurate estimate of RMS
```

qpuw

Quality guided algorithm for phase unwrapping

Description

Quality guided algorithm for two dimensional phase unwrapping.

Usage

```
qpuw(phase, qual)
```

Arguments

phase	A matrix of wrapped phase values
qual	A matrix of quality values the same size as phase.

Value

puw A matrix of class "[pupil](#)" with the unwrapped wavefront.

Note

This is a straightforward implementation of the quality guided algorithm of G&P.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

References

Ghiglia, D.C., and Pritt, M.D., 1998, **Two-Dimensional Phase Unwrapping**, New York: Wiley & Sons, Inc., ISBN 0-471-24935-1.

See Also

[idiffpuw](#), [brcutpuw](#), [modalpuw](#), [lspuw](#)

readjpeg

Read a jpeg or tiff file

Description

Reads a jpeg or tiff file and combines the channels to produce a monochrome image in a matrix.

Usage

```
readjpeg(filename, channels)
readtiff(filename, channels)
```

Arguments

filename	File name
channels	A vector of length 3 with the channel weights

Details

Values in channels should be non-negative, but need not add to one.

Value

A double precision matrix with the image data.

Note

The matrix must have rows reversed and transposed to display properly with `image()`.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

rescale	<i>Rescale an image.</i>
---------	--------------------------

Description

Rescale a matrix containing a bitmapped image using bilinear interpolation.

Usage

```
rescale(im, scale)
```

Arguments

im	A matrix with image data.
scale	Scale factor.

Details

A value <1 will shrink the image.

Value

A matrix containing the rescaled image data.

Note

NA's are OK.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

Called by [load.images](#) if necessary.

rmap	<i>Utilities for phase unwrapping</i>
------	---------------------------------------

Description

Utility functions for use in 2D phase unwrapping.

Usage

```
rmap(phase, dx = NULL, dy = NULL, plot = FALSE, ...)  
wrap(phase)
```

Arguments

<code>phase</code>	Matrix of wrapped phase values
<code>dx</code>	Matrix of x differences
<code>dy</code>	Matrix of y differences
<code>plot</code>	Boolean: plot residue positions?
<code>...</code>	additional arguments for <code>image</code>

Details

`dx` and `dy` must have the same dimension as `phase`.

Value

In `rmap` if `plot == TRUE`

`nr` the number of residues identified in the map

otherwise

`phase` wrapped phase returned by `wrap`

`residues` Matrix the same size as `phase` with residues marked as + or - 1.

Note

These are primarily intended for internal use but can be used interactively. Calling `rmap(phase, plot=TRUE)` will plot the positions of residues and return nothing. If `(plot==FALSE)` in the call to `rmap` a matrix the same size as `phase` is returned with residues identified with values of +1 or -1.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>. Steve Koehler is responsible for the efficient implementation of the `wrap` function.

References

Ghiglia, D.C., and Pritt, M.D., 1998, **Two-Dimensional Phase Unwrapping**, New York: Wiley & Sons, Inc., ISBN 0-471-24935-1.

Called by [modalpuw](#), [idiffpuw](#), [brcutpuw](#).

`rygcb`*A better rainbow.*

Description

Produces a rainbow color palette with colors ranging from "red" to "blue" or "magenta". Perceptual uniformity should be superior to R's `rainbow`.

Usage

```
rygcb(n)
rygcbm(n)
```

Arguments

<code>n</code>	Number of color levels
----------------	------------------------

Details

The palette is created using `colorRampPalette`.

Value

A vector of colors.

Note

The call to `colorRampPalette` sets `space="Lab"` and `interpolate="spline"` with the intent of creating a more perceptually uniform rainbow.

<code>separate.wf</code>	<i>Separate wavefronts</i>
--------------------------	----------------------------

Description

Separate “polished in” from “instrumental” aberrations if possible

Usage

```
separate.wf(zcm, theta, maxorder = 14)
```

Arguments

<code>zcm</code>	Matrix of observed Zernike coefficients
<code>theta</code>	Vector of rotation angles (in radians)
<code>maxorder</code>	Maximum Zernike order to extract

Value

<code>zcb</code>	Table of extracted coefficients and standard errors
------------------	---

Author(s)

M.L. Peck

<code>startest</code>	<i>Star test simulator</i>
-----------------------	----------------------------

Description

Simulates a star test.

Usage

```
startest(wf=NULL, zcoef=NULL, zlist=makezlist(), phi=0,
lambda = 1, defocus=5,
nrow = 255, ncol = nrow,
cp = list(xc=128,yc=128,rx=127,ry=127,obstruct=0),
obstruct=NULL, npad = 4,
gamma=2, psfmag=2, displaymtf=TRUE, displaywf=FALSE)
```

Arguments

<code>wf</code>	A matrix of class <code>pupil</code> containing wavefront values
<code>zcoef</code>	Vector of Zernike coefficients
<code>zlist</code>	Indexes of Zernike coefficients
<code>phi</code>	Angle to rotate wavefront
<code>lambda</code>	Wavelength, in same units as coefficients
<code>defocus</code>	Amount of defocus in waves
<code>nrow</code>	# rows in pupil matrix
<code>ncol</code>	# columns in pupil matrix
<code>cp</code>	pupil parameters
<code>obstruct</code>	Obstruction fraction
<code>npad</code>	Pad factor for FFT
<code>gamma</code>	Gamma value for graphics display
<code>psfmag</code>	Magnification factor for in focus PSF display
<code>displaymtf</code>	Logical: Display MTF?
<code>displaywf</code>	Logical: Display calculated wavefront?

Details

If `wf` is `NULL` the wavefront is calculated from the the Zernike coefficients (which should be non-`NULL`).

Value

A list with the following components:

<code>psf</code>	The in focus point spread function.
<code>otf</code>	The complex optical transfer function, a complex matrix of size <code>pupilsizes</code> .
<code>mtf</code>	The modulation transfer function, a real matrix of size <code>pupilsizes</code> .

```

```
synth.interferogram
```

Synthetic interferogram

Description

Compute and display a synthetic interferogram.

Usage

```
synth.interferogram(wf = NULL, zcoef = NULL, zlist = NULL,  
  nr = nrow(wf), nc = ncol(wf), cp = NULL,  
  phi = 0, addzc = rep(0, 4), fringescale = 1, plots = TRUE)
```

Arguments

<code>wf</code>	A matrix of wavefront values
<code>zcoef</code>	A vector of Zernike coefficients
<code>zlist</code>	A list of Zernike indexes
<code>nr</code>	Number of rows in the output matrix
<code>nc</code>	Number of columns in the output matrix
<code>cp</code>	A list describing the pupil boundaries, as created by pupil.pars
<code>phi</code>	Amount to rotate the wavefront, in degrees
<code>addzc</code>	A 4-vector with piston, tilt, and defocus terms to be added
<code>fringescale</code>	Fringe scale. Should be 1 for single pass, 0.5 for double, etc.
<code>plots</code>	Logical: Plot the interferogram?

Details

Either `wf` or `zcoef` should be non-null, but not both. If `zcoef` is specified `zlist` must be as well.

Additional piston, tilt, and defocus terms can be added to the calculated wavefront using `addzc`.

Value

A matrix of intensity levels in the calculated interferogram, assigned class "[pupil](#)".

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

[pupil.](#)

Examples

```
# create a list of zernikes
zcoef <- rnorm(length(zlist.fr$n), mean=0, sd=0.01)

iwf <- synth.interferogram(zcoef=zcoef, zlist=zlist.fr)

X11()

# show again with some tilt

iwf <- synth.interferogram(zcoef=zcoef, zlist=zlist.fr, addzc=c(0,5,5,0))
```

turbwf	<i>Kolmogorov Turbulence</i>
--------	------------------------------

Description

Simulates the optical effects of atmospheric turbulence using Noll's (1976) calculation of the covariance matrix of Zernike polynomials under Kolmogorov turbulence.

Usage

```
turbwf(friedratio = 1, zlist = makezlist(2, 40), reps = 1)
```

Arguments

friedratio	Ratio of pupil diameter to Fried parameter
zlist	A list of Zernikes, as returned for example by makezlist
reps	Number of draws to simulate

Details

The default value of zlist has 440 elements, which may be more than necessary for a reasonable representation of an “atmospheric” wavefront.

Value

A list with the following components:

zcoef.turb	A <code>reps x length(zlist\$n)</code> matrix of simulated draws of Zernike coefficients.
v	Covariance matrix of the indexed Zernikes.

Note

Typos in the original source material have been corrected in the code. Note that scintillation is not modelled.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

References

Noll, R.J. 1976, **Zernike polynomials and atmospheric turbulence**, *J. Opt. Soc. Am.*, Vol. 66, No. 3, p. 207.

See Also

[Zernike](#), [pupil](#).

Examples

```
# Simulate a single draw from a turbulent atmosphere
zcoef.turb <- turbwf(friedratio=5, zlist=makezlist(2,30), reps=1)$zcoef.turb
# Warning: this can take a while
wf <- pupil(zcoef=zcoef.turb, zlist=makezlist(2,30))
plot(wf)
summary(wf)
```

wf.net

Wavefront smoothing

Description

Calculate net and smoothed wavefronts from a raw wavefront containing low order nuisance aberrations.

Usage

```
wf.net(wf.raw, rho=NULL, theta=NULL, cp, sgs=3, zlist=makezlist(),
       zc0=c(1:3, 6:7), satarget=c(0,0), astig.bath=c(0,0),
       uselm=FALSE, plots=TRUE)
```

Arguments

wf.raw	Raw wavefront to be processed
rho	Radial coordinates in pupil as returned by pupil.rhotheta
theta	Angular coordinates in pupil as returned by pupil.rhotheta
cp	A list describing the pupil boundary, as returned by pupil.pars
sgs	Sample Grid Spacing for least squares fits to wavefront values
zlist	Indexes of Zernike polynomials to fit to wavefront
zc0	Indexes of Zernike coefficients to be removed from net wavefront
satarget	Target 4th and 6th order SA coefficients in non-null tests of aspheres
astig.bath	Astigmatism coefficients for Bath geometry
uselm	Boolean: use lm() for least squares fit
plots	Logical: plot calculated wavefronts?

Details

In performing least squares fits to the raw data the pupil is sampled on a square grid with spacing `sgs` by `sgs` pixels. The default value of 3 appears to give a sufficiently dense sample for typical video resolution images without using too much memory or CPU cycles.

Passing `rho` and `theta` is optional. If `rho` is `NULL` they are calculated using `pupil.rhotheta`.

In a non-null test of an asphere setting `satarget` to the desired Zernike coefficients for 3rd and 5th order spherical aberration will produce a net wavefront with the target SA coefficients removed.

Value

A list with the following components:

<code>wf.net</code>	Net unsmoothed wavefront; a matrix of class " <code>pupil</code> "
<code>wf.smooth</code>	Net smoothed wavefront
<code>wf.residual</code>	Difference between net wavefront and polynomial fit
<code>fit</code>	Return value from <code>fitzernikes</code>
<code>zcoef.net</code>	Net Zernike coefficients from fit

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

Called by `fftfit`, `psifit`, `hkfit`, `pcafit`, `aiafit`.

Calls `fitzernikes`, `pupil`.

`wf3d.pupil`

OpenGL wavefront plot

Description

Interactive plot of a wavefront using the OpenGL package `rgl`. This is a 3D plotting method for objects of class "`pupil`".

Usage

```
wf3d.pupil(wf, cp=NULL, zoom.wf = 1, surf.col = topo.colors(256), bg.col = "black",
           eqa=FALSE)
```

Arguments

<code>wf</code>	A matrix of wavefront values
<code>cp</code>	A list describing the pupil boundary
<code>zoom.wf</code>	Zoom factor for heights
<code>surf.col</code>	Color palette for surface
<code>bg.col</code>	Background color
<code>eqa</code>	Equal area per color?

Details

The default color palette will match the colors in the default version of `plot.pupil`.

Value

none

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

References

The **rgl** package is described at <http://rgl.neoscientists.org/about.shtml>, and available from CRAN.

See Also

`plot.pupil`

Examples

```
# create a random wavefront

wf <- pupil(zcoef=rnorm(length(makezlist())$n), mean=0, sd=0.01)
# the default method

plot(wf)

#this is more fun

wf3d(wf)
```

zconic

Zernike coefficients for a conic surface

Description

Calculates the radially symmetric Zernike coefficient values up to order nmax for a conic surface relative to a sphere of the same paraxial radius of curvature.

Usage

```
zconic(D, rc, b = -1, lambda = 1e-06, nmax = 6)
```

Arguments

D	Diameter
rc	Radius of curvature
b	Conic constant
lambda	Wavelength – defaults to 1 nm.
nmax	Maximum radial polynomial order

Details

D, rc, and lambda must have the same units.

Value

A vector of length $n_{\max}/2-1$ of coefficient values, in increasing radial order, $n=c(4,6, \dots)$.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

[Zernike](#)

Examples

```
zconic(200,2000)
zconic(10, 20, b=-1.05, lambda=632.8E-9, nmax=12)
```

Zernike

Zernike Polynomials

Description

Routines for creating and manipulating Zernike polynomials.

Usage

```
Zernike(rho, theta, n, m, t)
DZernike(rho, theta, n, m, t)
DTZernike(rho, theta, n, m, t)
rzernike(rho, n, m)
drzernike(rho, n, m)
```

Arguments

rho	normalized radius, $0 \leq \rho \leq 1$
theta	angular coordinate
n	radial polynomial order
m	azimuthal order
t	character for trig function: one of c("n", "c", "s")

Note

These functions return Zernikes scaled such that they form an orthonormal basis set for the space of functions defined on the unit circle. Note that this is not the most commonly used definition (as given e.g. in *Born and Wolf*). The definition I use is often associated with *Noll (1976)*.

The function [zmult](#) can be used to convert between normalized and conventionally defined vectors of Zernike coefficients.

The basic low level functions `rzernike` and `drzernike` use numerically stable recurrence relationships for the radial Zernikes.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

Examples

```
Zernike(1, 0, 4, 0, "n") # == sqrt(5)

# A slightly more complex example

rho <- seq(0, 1, length = 101)
theta <- rep(0, 101)

plot(rho, Zernike(rho, theta, 6, 0, "n"), type="l",
      ylim=c(-3.5, 3.5), main="Some 6th order Zernike Polynomials")
lines(rho, Zernike(rho, theta, 5, 1, "c"), lty=2)
lines(rho, Zernike(rho, theta, 4, 2, "c"), lty=3)
lines(rho, Zernike(rho, theta, 3, 3, "c"), lty=4)
```

zlist

Lists of Zernike polynomial indexes

Description

Ordered lists of Zernike polynomial indexes.

Usage

```
makezlist(minorder = 2, maxorder = 14)
zlist.fr
zmult(zlist = makezlist())
```

Arguments

minorder	minimum value of $n+m$
maxorder	maximum value of $n+m$
zlist	a list of the form returned by <code>makezlist</code>

Details

Zernike polynomials are indexed by a radial index n , an azimuthal index m , and include cosine, sine, and radial terms. These routines return lists of indexes using a popular ordering scheme for Zernike polynomials.

Value

`makezlist` and `zlist.fr` return lists with the following components:

<code>n</code>	radial order
<code>m</code>	azimuthal order
<code>t</code>	one of <code>c</code> ("c", "s", "n")

`zmult` returns a vector the same length as the components of `zlist`.

Note

`zlist.fr` is an augmented “Fringe” set of Zernike polynomials equivalent to `makezlist(2,12)`.

`makezlist` returns a complete list of indexes for all orders from `minorder` through `maxorder`, where “order” is the value of $n+m$.

Author(s)

M.L. Peck <mpeck1@ix.netcom.com>

See Also

Virtually all high level functions that work with Zernike polynomials use these lists. See for example [pupil](#), [psifit](#), [fftfit](#).

Examples

```
zlist <- makezlist(2,12)
zcoef <- rnorm(length(zlist))
zcoef # a vector of normalized Zernike coefficients
zcoef*zmult(zlist) # Coefficients in conventional representation
sqrt(crossprod(zcoef)) # This is the RMS error of the wavefront
# constructed from these Zernikes
```

zmoments

Zernike moments

Description

Calculate Zernike moments from a vector of coefficients

Usage

```
zmoments(zcoef, maxorder = 14)
```

Arguments

zcoef	Zernike coefficients
maxorder	Maximum order to return

Value

A table of the moments along with radial and azimuthal orders

References

M.L. Peck

zpm	<i>Matrixes of Zernike polynomials</i>
-----	--

Description

Create a matrix of Zernike polynomial values, or their derivatives or gradient.

Usage

```
zpm(rho, theta, phi= 0 , maxorder = 14)
zpm.arb(rho, theta, phi = 0, zlist = makezlist())
filldzm(rho, theta, phi = 0, zlist = makezlist())
fillgradientzm(rho, theta, phi = 0, zlist = makezlist())
```

Arguments

rho	A vector of radial coordinates.
theta	A vector of angular coordinates, in radians.
phi	Orientation of the image, in degrees
zlist	A list of indexes, as returned by makezlist
maxorder	The maximum Zernike polynomial order

Details

rho and theta must be the same length.

Value

zpm, zpm.arb and filldzm return a matrix of size `length(rho) x length(zlist$n)` with values of Zernike polynomials or their radial derivatives evaluated at the polar coordinates `(rho, theta-pi*phi/180)`.

fillgradientzm returns the gradient, in polar coordinates, of Zernikes in a `2*length(rho) x length(zlist$n)` matrix. Rows `1:length(rho)` contain the radial derivative, followed by `1/rho` times the tangential derivative.

Note

These are used by various routines to make least squares fits of sets of Zernike polynomials to measured wavefront values.
